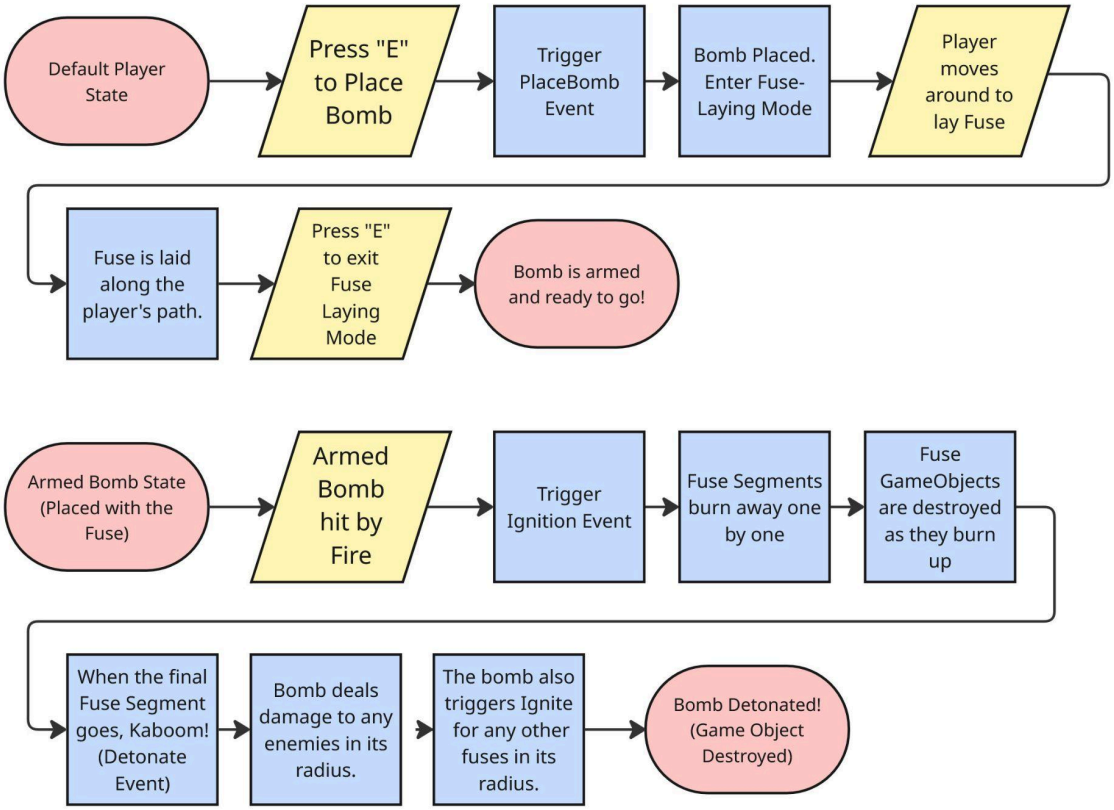
GAME10017 - ASSIGNMENT 2

EVENT-DRIVEN SYSTEMS IMPLEMENTATION - BY JAKE KIELTY

Feature: Bomb and Fuse

This gameplay mechanic involves a bomb that the player can place, run a fuse for, and then ignite via fire arrows. The basic idea here is that you've got the classic Zelda bomb, but with a fuse. To use this item, players must press "E" to place the bomb itself and enter the fuse-laying mode, and then they must press "E" again to exit fuse-laying mode. While in fuse-laying mode, as they move around, the player will periodically lay down bits of fuse that can later be ignited to set off the bomb.

Event Flow



Event Flow (Continued)

Generally, I have three events in this system, PlaceBomb, Ignite, and Detonate, and all three are fairly straightforward.

PlaceBomb is entirely for placing the bomb itself, as I needed something that could talk across classes, and events work nicely for that.

Ignite is for igniting the fuse, and can be triggered by two things: Fire Arrows, and Bomb Explosions. Both of these will allow the player to ignite their fuses, and can enable complex strategies such as chaining bombs together.

Detonate is for setting off the bomb, and this is so that I can make sure that I am able to call the whole process of detonating the bomb, starting the VFX, and then later clean all of it up without having to worry about referencing classes and the like.

Events and Modularity

In general, events are extremely useful as they let you decouple bits of code from each other. This essentially lets you have two separate bits of code that work together, but don't *depend* on each other like Methods inside classes might. The biggest strength is that you can essentially call up *any function from anywhere*, so it means you can make far more self-contained and modular functions that don't *have* to be intricately tied into this and/or other classes.

Challenges and Solutions

I have had *many* challenges with this assignment (more due to scheduling and workload issues than anything else) and as a result, I have unfortunately not been able to complete it. I am realizing now that I really should've just gone with something else for my gameplay mechanic. I managed to get some of the basic functionality working, but nothing that is approaching completion yet. I don't know what else to say here other than the straightforward facts that I need to be more careful about prioritizing assignments, and that I need to be more proactive about asking for help when I need it.

(I know this is all very shoddy, I'm sorry. I've been having a terrible semester.)
